

SESSION 01 • YEAR ONE — THE REFERRAL DECISION

Save or Extract?

A Framework for the Periodontally Compromised Tooth

PRESENTED BY

Jonathan Misch,
DDS, MS

CEO, Misch Implant Institute

@drjmisch

The question general dentists face multiple times a week — and while human biology can be complex, the decision framework doesn't have to be. We work through prognosis classification, the significance of furcation involvement and vertical bone loss, and how to structure the save-vs.-extract conversation at the chair — introducing the implant as the **planned replacement, not a last resort.**

LEARNING OBJECTIVES

- 01** Classify the prognosis of a periodontally compromised tooth using furcation involvement and vertical bone loss.
- 02** Recognize when saving a tooth delays the inevitable — and costs the patient the bone they will need for an implant.
- 03** Structure the save-vs.-extract conversation chairside, positioning the implant as the patient's definitive plan.
